# Healthline Information Systems

Data Acquisition, Management and System Integration Solutions for Healthcare

Active ⊕ Link

Active ⊕ Link is the smart choice to empower MEDITECH EMR users with direct access to patient information stored in other systems, such as PACS, Cardiology or for a RHIO. In addition to seamless access to other application content, the **Active ⊕ Help** feature supports *automatic context aware* display of custom and standard help information. The help content is automatically presented when the user enters or exits the respective application screen, or in some cases, data entry fields. **Active ⊕ Help** improves the end user application experience, translating into more usage and productivity.

Features and Benefits of Healthline Active ⊕ Link

● Supports Windows and MEDITECH applications (currently EMR).

● Associate 1-n external application(s) with 1-n application screens.

● Pass user and patient/visit context to target application. User does not need to login and pick the patient again, when supported by target application.

● Client side install only, no MEDITECH host side footprint or Windows server side install required.

● Associate Active ⊕ Help content (text or mutli-media) for any Windows screen/field or MEDITECH.

Active ⊕ Link DB Server option

● Supports SQL storage, Archive engine, HL7 and other EDI features.

● Provides platform for RHIO support, patient identification normalization and 3rd party application access gateway.

● Supports *"enable if data present"* feature for Active ⊕ Link. The user is only presented with the choice if the target system actually has the desired content.
